RISK MITIGATION FILTER

Completing the Filter, Step by Step

The guide explains how to complete and read both sides of the Risk Mitigation Filter.

STEP-BY-STEP GUIDE

Completing the Risk Mitigation Filter A Step-by-Step Guide for Users

The Risk Mitigation Filter (RMF) is a short paper form that helps a producer compare potential alternatives. It places the status quo and other realistic choices side by side, identifies key risk and feasibility considerations, and indicates when a decision needs a deeper RightRisk tool or specialist review. The RMF does not select an alternative or recommend a decision. The ratings reflect the producer's judgment about the operation and the decision being evaluated. Some decisions can stop with the RMF; others need more analysis.

The current RMF can be downloaded at VirtualFence.RightRisk.org. It is two-page form: the front page contains the decision problem and comparison table. The back page records decision status, tool routing, key uncertainties, notes, and final checks.

RightRisk Analytics

Tools and guides are available at no cost at the website <https://RightRisk.org>

The guide is designed to be used alongside the form.

FRONT PAGE

- Decision problem
- Status quo plus up to five producer-selected alternatives
- Eight criteria columns
- Row-level Next Step routing

BACK PAGE

- Decision outcome
- Tool routing
- Key uncertainties and notes
- Escalation and fit-for-purpose checks

Current rating definitions and routing rules are held in the guide.
