The Risk Scenario Planning (RSP) Tool

A RightRisk tool for decisions shaped by near-term uncertainty.

WHAT IT DOES

Compares management alternatives by analyzing a range of possible outcomes when the future is uncertain.

HOW IT WORKS

- Key assumptions and ranges are entered for uncertain factors.
- The tool runs scenarios to show possible outcomes and their likelihood.
- Results are presented as probability distributions to highlight risk and trade-offs.

WHEN IT HELPS

- When screening suggests more review is needed.
- When the main question turns on a small number of uncertain values.
- When comparing the range of possible financial or production effects.

The result is a range of outcomes, not a verdict.
